

High quality linear bioceramic cartridges healthy water in your house

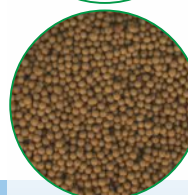

Advantages:

- Perfect quality
- Water ionisation (emission up to 2,000 ni/cm³)
- Control of pH of the body fluids
- Faster removal of toxins from the body
- Compatible with the majority of filtering systems available on the market
- Competitive price
- Quick delivery of orders
- High quality

They show features that may contribute to increase of water pH

They contain high quality bioceramic deposit

It matches the majority of filtering systems available on the market

Water subjected to an energising process FIR shows positive impact on the human body

www.supremefilters.com

Description:

Linear energising cartridges 2" filled with bioceramic deposit. Used after the osmotic filtration process.

The cartridges emit radiation of 2,000 ni/cm³. FIR infrared radiation leads to breakdown of large water clusters into smaller ones, and, therefore, to faster and more efficient hydration, as well as quicker removal of toxins from the body.

Moreover, they show features that may contribute to the increase of water pH.

In S-L-FIR cartridge, water does not contact a deposit.

Drinking water subjected to FIR energising process contributes to the improvement of the general body condition, resistance to infections, and metabolism.

The cartridge is compatible with most RO systems available on the market. It has a valid attestation of the Polish National Institute of Hygiene (PZH) which allows the product to come into contact with potable water.

Technical information:

- dimensions: 10" x 2"
- connector: 1/4" MIP
- efficiency: 2,9l/min
- work. temp.: 2°C - 45°C
- longevity: 6-12 months
